

YASKAWA Electric Corporation

SR100 Ethernet

Supported version TOP Design Studio V1.4.4 or higher

CONTENTS

We would like to thank our customers for using M2I's "Touch Operation Panel (M2I TOP) Series". Read this manual and familiarize yourself with the connection method and procedures of the "TOP and external device".

1. System configuration [Page 2](#)

Describes the devices required for connection, the setting of each device, cables, and configurable systems.

2. External device selection [Page 3](#)

Select a TOP model and an external device.

3. TOP communication setting [Page 4](#)

Describes how to set the TOP communication.

4. Supported addresses [Page 9](#)

Refer to this section to check the addresses which can communicate with an external device.

1. System configuration

The system configuration of TOP and "YASKAWA Electric Corporation – SR100" are as follows:

Series	Communication method	Communication setting	Cable
YASKAWA Electric Corporation – SR100	TCP	3. TOP communication setting	Twisted pair Cable ^{*Note 1)}

^{*Note 1)} Twisted pair cable

- Refer to STP (Shielded Twisted Pair Cable) or UTP (Unshielded Twisted Pair Cable) Category 3, 4, 5.
- Depending on the network configuration, you can connect to components such as the hub and transceiver, and in this case, use a direct cable.

■ Connectable configuration

- 1:1 connection (one TOP and one external device) connection

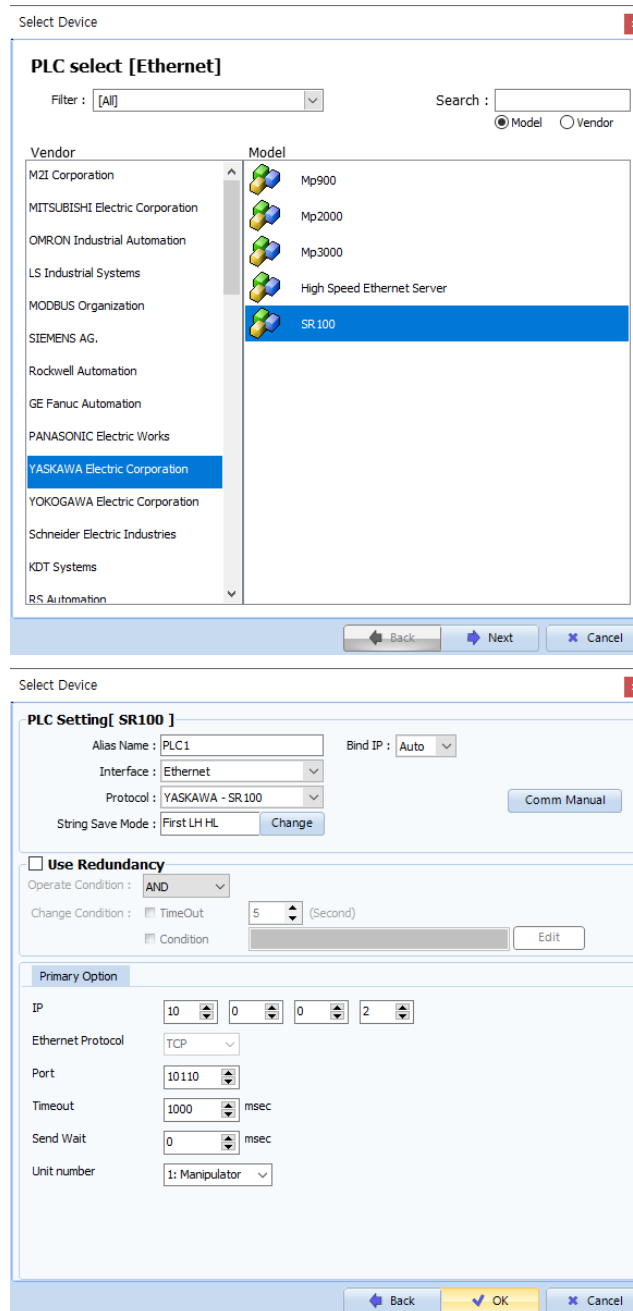

- 1:N connection (one TOP and multiple external devices) connection

2. External device selection

- Select a TOP model and a port, and then select an external device.

Settings		Contents					
TOP	Model	Check the TOP display and process to select the touch model.					
External device	Vendor	Select the vendor of the external device to be connected to TOP. Please select "YASKAWA Electric Corporation".					
	PLC	Select the external device to be connected to the TOP. <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="background-color: black; color: white;">Model</th> <th style="background-color: black; color: white;">Interface</th> <th style="background-color: black; color: white;">Protocol</th> </tr> </thead> <tbody> <tr> <td>SR100</td> <td>Ethernet</td> <td>SR100</td> </tr> </tbody> </table> <p>Please check the system configuration in Chapter 1 to see if the external device you want to connect is a model whose system can be configured.</p>	Model	Interface	Protocol	SR100	Ethernet
Model	Interface	Protocol					
SR100	Ethernet	SR100					

3. TOP communication setting

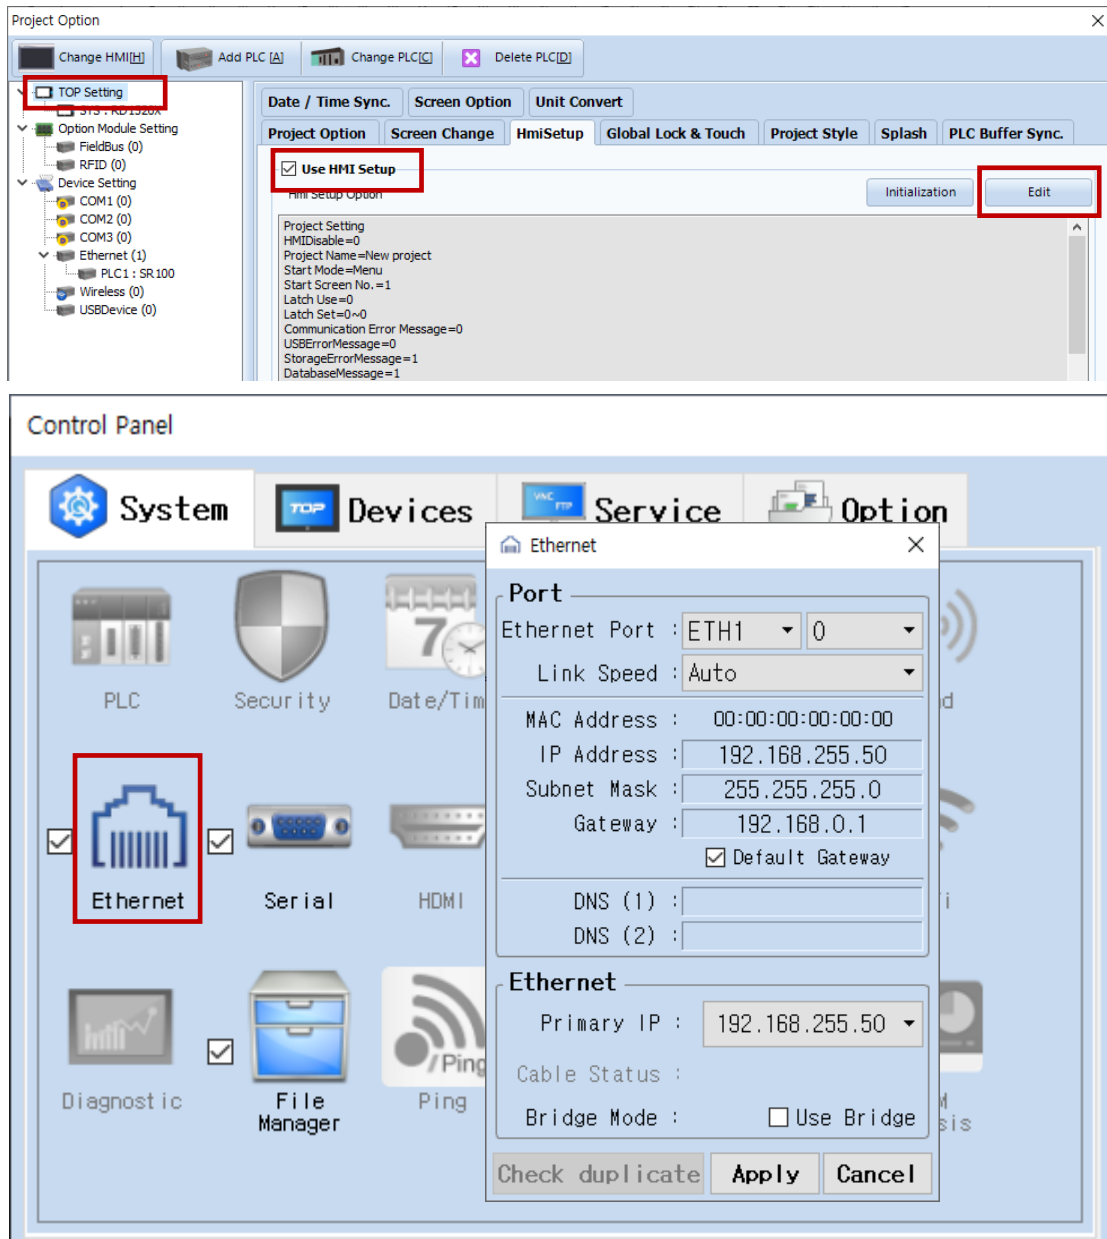

The communication can be set in TOP Design Studio or TOP main menu. The communication should be set in the same way as that of the external device.

3.1 Communication setting in TOP Design Studio

(1) Communication interface setting

■ [Project > Project Property > TOP Setting] → [Project Option > "Use HMI Setup" Check > Edit > Ethernet]

– Set the TOP communication interface in TOP Design Studio.

Items	TOP	External device	Remarks
IP Address* Note 1 Note 2)	192.168.255.50	192.168.255.1	
Subnet Mask	255.255.255.0	255.255.255.0	
Gateway	192.168.0.1	192.168.0.1	

*[Note 1](#)) The network addresses of the TOP and the external device (the first three digits of the IP, 192 . 168 . 0 . 0) should match.

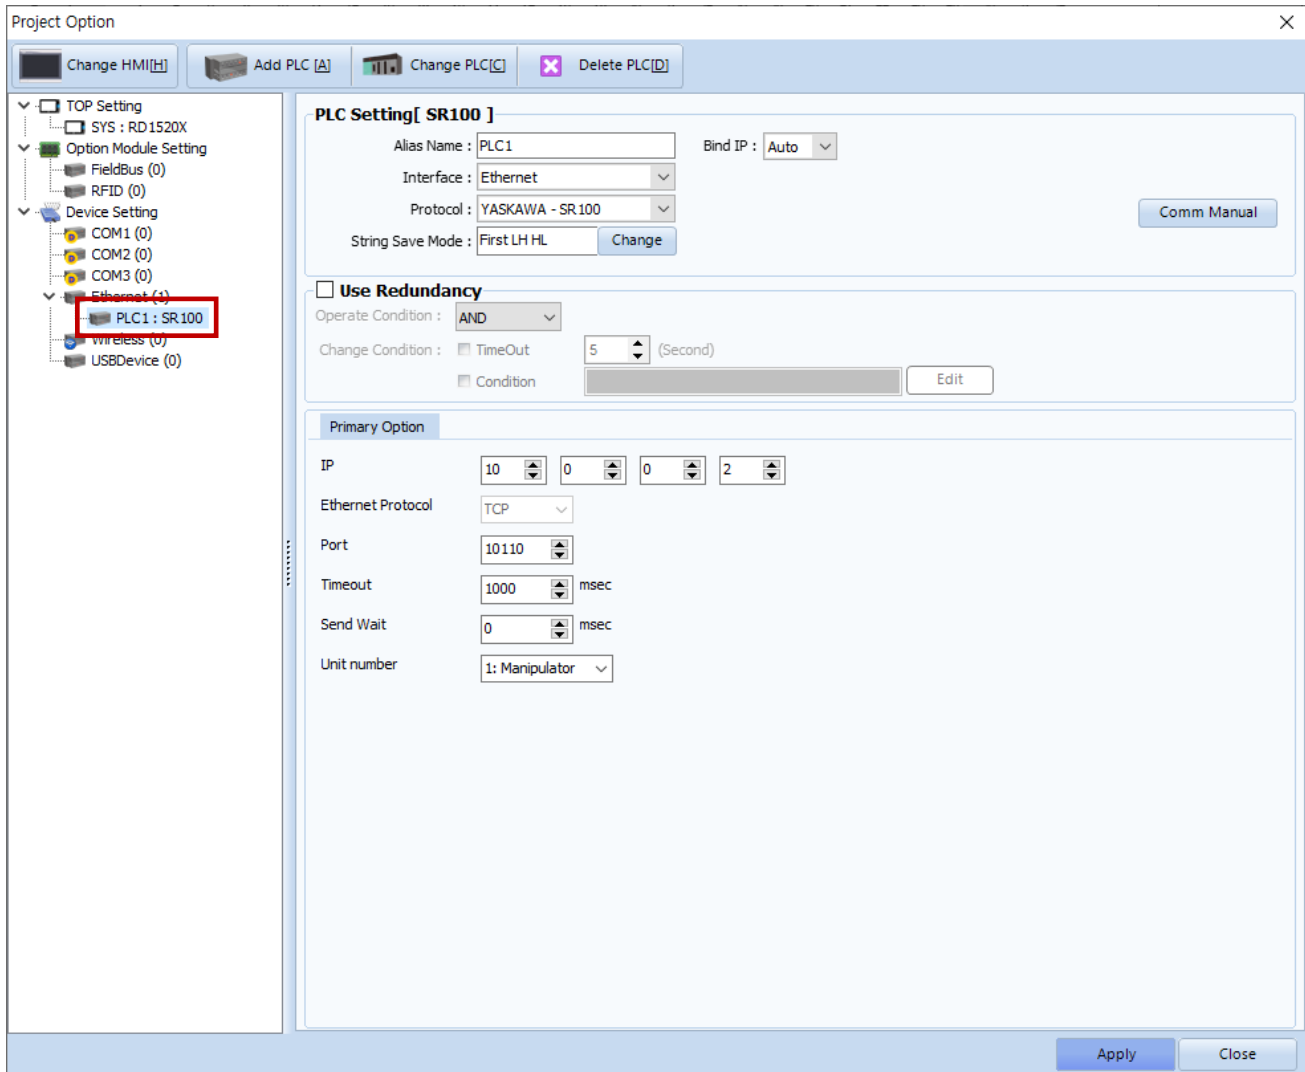

*[Note 2](#)) Do not use duplicate IP addresses over the same network.

* The above settings are examples recommended by the company.

Items	Description
IP Address	Set an IP address to be used by the TOP to use over the network.
Subnet Mask	Enter the subnet mask of the network.
Gateway	Enter the gateway of the network.

(2) Communication option setting

- [Project > Project Property > Device Setting > ETHERNET > "PLC1 : SR100"]
 – Set the options of the SR100 communication driver in TOP Design Studio.

Items	Settings	Remarks
Interface	Select "Ethernet".	Refer to "2. External device selection" .
Protocol	Select "SR100".	
IP	Enter the IP address of the external device.	
Ethernet Protocol	Select the Ethernet protocol between the TOP and an external device.	Fixed
Port	Enter the Ethernet communication port number of an external device.	Fixed
TimeOut (ms)	Set the time for the TOP to wait for a response from an external device.	
SendWait (ms)	Set the waiting time between TOP's receiving a response from an external device and sending the next command request.	
Unit number	1: Manipulator, 2: Set the Unit number which corresponds to Pre-aligner.	

3.2. Communication setting in TOP

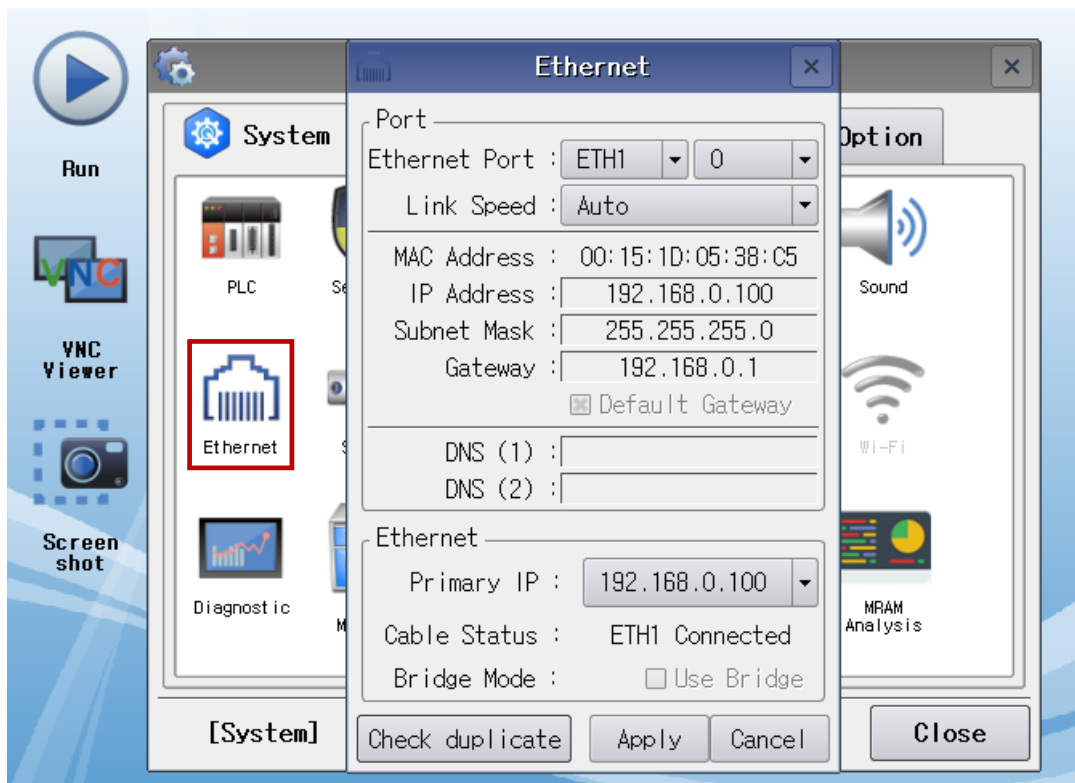

* This is a setting method when "Use HMI Setup" in the setting items in "3.1 TOP Design Studio" is not checked.

- Touch the top of the TOP screen and drag it down. Touch "EXIT" in the pop-up window to go to the main screen.

(1) Communication interface setting

- [Main Screen > Control Panel > Ethernet]

Items	TOP	External device	Remarks
IP Address*Note 1) Note 2)	192.168.255.50	192.168.255.1	
Subnet Mask	255.255.255.0	255.255.255.0	
Gateway	192.168.0.1	192.168.0.1	

*Note 1) The network addresses of the TOP and the external device (the first three digits of the IP, 192 . 168 . 0 . 0) should match.

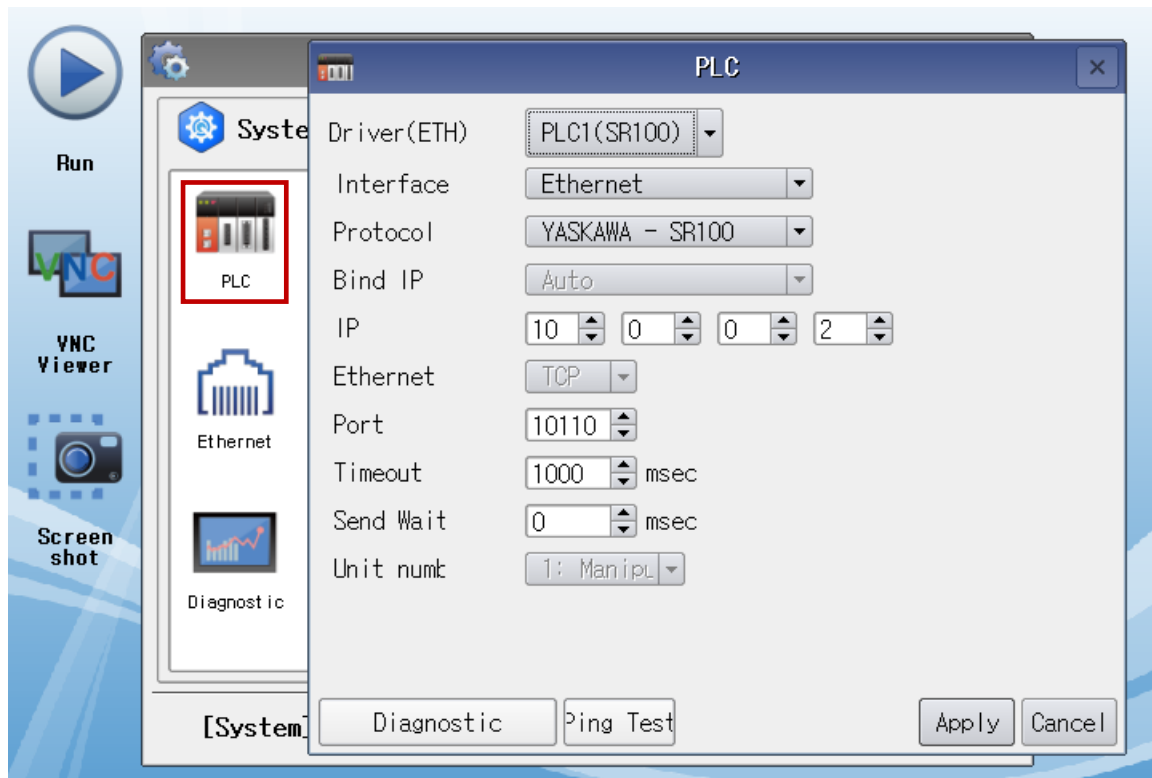

*Note 2) Do not use duplicate IP addresses over the same network.

* The above settings are examples recommended by the company.

Items	Description
IP Address	Set an IP address to be used by the TOP to use over the network.
Subnet Mask	Enter the subnet mask of the network.
Gateway	Enter the gateway of the network.

(2) Communication option setting

■ [Main Screen > Control Panel > PLC]

Items	Settings	Remarks
Interface	Select "Ethernet".	Refer to "2. External device selection".
Protocol	Select "SR100".	
IP	Enter the IP address of the external device.	
Ethernet Protocol	Select the Ethernet protocol between the TOP and an external device.	Fixed
Port	Enter the Ethernet communication port number of an external device.	Fixed
TimeOut (ms)	Set the time for the TOP to wait for a response from an external device.	
SendWait (ms)	Set the waiting time between TOP's receiving a response from an external device and sending the next command request.	
Unit number	1: Manipulator, 2: Set the Unit number which corresponds to Pre-aligner.	

3.3 Communication diagnostics

- Check the interface setting status between the TOP and an external device.
 - Touch the top of the TOP screen and drag it down. Touch "EXIT" in the pop-up window to go to the main screen.
 - Check if the ETH port settings you want to use in [Control Panel > Ethernet] are the same as those of the external device.

- Diagnosis of whether the port communication is normal or not
 - Touch "Communication diagnostics" in [Control Panel > PLC].
 - The Diagnostics dialog box pops up on the screen and determines the diagnostic status.

OK	Communication setting normal
Time Out Error	Communication setting abnormal - Check the cable, TOP, and external device setting status. (Reference: Communication diagnostics sheet)

- Communication diagnostics sheet
 - If there is a problem with the communication connection with an external terminal, please check the settings in the sheet below.

Items	Contents	Check		Remarks	
System configuration	How to connect the system	OK	NG	1. System configuration	
	Connection cable name	OK	NG		
TOP	Version information	OK	NG	2. External device selection 3. Communication setting	
	Port in use	OK	NG		
	Driver name	OK	NG		
	Other detailed settings	OK	NG		
	Relative prefix	Project setting	OK		NG
		Communication diagnostics	OK		NG
	Ethernet port setting	IP Address	OK		NG
Subnet Mask		OK	NG		
Gateway		OK	NG		
External device	CPU name	OK	NG	4. External device setting	
	Communication port name (module name)	OK	NG		
	Protocol (mode)	OK	NG		
	Setup Prefix	OK	NG		
	Other detailed settings	OK	NG		
	Ethernet port setting	IP Address	OK		NG
		Subnet Mask	OK		NG
Gateway		OK	NG		
Check address range	OK	NG	5. Supported addresses (For details, please refer to the PLC vendor's manual.)		

4. Supported addresses

The devices available in TOP are as follows:

The device range (address) may differ depending on the CPU module series/type. The TOP series supports the maximum address range used by the external device series. Please refer to each CPU module user manual and be take caution to not deviate from the address range supported by the device you want to use.

Action Commands

Name	Function	M	P
INIT	Initializes specified unit Initializes specified unit. • Error clear • Servo ON • Go to HOME position	V	V
MTRS	Performs wafer transfer operation (Get operations/Put operations/Exchange operations) Performs wafer transfer (Get/Put/Exchange) operations for the specified transfer station.	V	
MPNT	Moves to the specified transfer point. Moves to the specified transfer point through "MTRS" or "MCTR" command execution.	V	
MCTR	Continued wafer transfer operation + Transfer operation. Immediately after the "MTRS" or "MCTR" command, the specified wafer transfer operation continues, and once the operation is completed, the wafer transfer operation of the newly specified station is performed.	V	
MTCH	Moves to the specified position (registered position/ready position). Moves to the specified location on the specified transfer station.	V	
MABS	Moves the specified axis to a specified coordinate position. Moves the specified axis to a specified coordinate position.	V	
MREL	Moves the specified axis to the specified relative position. Moves the specified axis to the specified relative position.	V	V
MMAP	Performs the wafer mapping. Performs the wafer mapping in the specified transfer station.	V	
MMCA	Performs the mapping calibration. Performs the mapping operation for the specified cassette station.	V	
MALN	Aligns the wafer on the pre-aligner. Aligns the wafer on the pre-aligner.		V
MACA	Performs alignment calibration. Performs alignment calibration for wafer alignment.		V

* M: Manipulator , P: Pre-aligner

Control Commands

Name	Function	M	P
CSTP	Applies deceleration/emergency stop to stop the motion. Applies deceleration/emergency stop to stop the motion of the device.	V	V
CRSM	Restarts the motion interrupted by deceleration stop. Restarts the motion interrupted by deceleration stop.	V	V
CSRV	Turns ON/OFF the servo power. Turns ON/OFF the servo power of the specified unit.	V	V
CCLR	Clears the current error or error history. Clears the current error or error history of the specified unit.	V	V
CSOL	Performs solenoid operation. Commands the wafer hold/release signal for the solenoid of the specified unit.	V	V

* M: Manipulator , P: Pre-aligner

Setting Commands

Name	Function	M	P
SSPD	Sets the motion speed. Sets the motion speed. (furnace-wafer feed rate, wafer feed speed, low feed speed, homing speed, low range speed)	V	V
SSLV	Selects the transfer speed level. Set the speed level. (no wafer, intra-wafer transfer rate, low transfer rate,) homing speed, low range speed)	V	V
SPOS	Registers the current position as the specified transfer station. Registers the current position of the specified unit as the specified transfer station.	V	
SABS	Registers the specified coordinate position as the specified transfer station. Registers the specified coordinate position as the specified transfer station in the specified unit.	V	
SAPS	Modifies the specified transfer station's registered position by the adjustment offset. Modifies the teaching position of the specified transfer station.	V	
SPDL	Deletes the specified transfer station's registered position. Deletes the specified transfer station's registered position in the specified unit.	V	
SPSV	Registers the position data in the volatile memory to the non-volatile memory. Registers the position data in the volatile memory to the non-volatile memory.	V	
SPLD	Reads the position data in the non-volatile memory into the volatile memory. Reads the position data in the non-volatile memory into the volatile memory.	V	
SSTR	Sets the station's information parameters. Sets the transfer station information.	V	
SPRM	Changes the parameter values. Changes the value of the specified parameter in the specified unit.	V	V
SMSK	Enables or disables the interlock monitoring function. Enables or disables the interlock signal monitoring function.	V	V
SSTD	Registers the current position as the manipulator coordinate's reference position. Registers the current position as the manipulator coordinate's reference position. This command registers the position in non-volatile memory.	V	
SSTN	Registers the specified number as a reference position. Specify the encoder value in the reference position and record the reference position. This command registers the position in non-volatile memory.	V	

* M: Manipulator , P: Pre-aligner

Reference Commands

Name	Function	M	P
RSPD	References the motion speed. Indicates the motion speed settings of the axis in the specified unit. (non-wafer speed, wafer speed, low speed, homing speed, low range speed) This command indicates the default speed setting for volatile memory.	V	V
RSLV	References the current transfer speed level. Refer to speed level of the current set transfer speed. Set (No wafer speed, wafer speed, low speed, homing speed, low range speed). Selects the high speed profile when the controller power is cycled (default).	V	V
RPOS	References the current position. References the current position in the specified unit.	V	
RSTP	References the registered position. References the registered position in the specified unit.	V	
RSTR	References the station information. References the stations information.	V	
RPRM	References the parameter value. References the parameter value in the specified unit.	V	V
RSTS	References the units' statuses. References various statuses.	V	V
RERR	References the error history. References the error record of the specified device.	V	V
RMSK	References the current interlock monitor settings. References Interlock Monitoring information.	V	V
RVER	References the software version. References software version.	V	V
RMAP	References the specified transfer station's mapping results. References the specified transfer station's mapping results.	V	
RMPD	References the mapping data (elevation axis coordinates during sensor edge startup/stopping). References the mapping data (elevation axis coordinates during sensor edge startup/stopping). Executes the mapping for the specified transport station.	V	
RMCA	References the mapping calibration result. References the mapping calibration result.	V	
RALN	References the alignment result. References the alignment result.		V
RACA	References the calibration results for alignment. References the calibration results for alignment.		V
RCCD	References the pre-aligner's light amount and CCD data. References the pre-aligner's light amount and CCD sensor value.		V
RLOG	References the log data. References the specified log data.	V	V
RSTN	References the reference position record. References the reference position.	V	

* M: Manipulator , P: Pre-aligner

Status

	Value	Status	Meaning
Sts1 (SYS:1000)	Bit0	Manipulator Battery status	The battery voltage status of the specified absolute encoder 1: Low battery voltage, 0: Normal state
	Bit1	Unit status	The command execution status of a drive/control command of the specified unit 1: Ready, 0: Busy
	Bit2	Servo status	The servo status of the specified unit 1: Servo OFF, 0: Servo ON
	Bit3	Servo status	Error status of the specified unit 1: Error occurrence, 0: No error occurrence
Sts2 (SYS:1001)	Bit0	controller battery status	Low voltage of memory backup battery 1: Battery voltage dropped, 0: Normal status
	Bit1	Wafer presence Status 1	For a manipulator, shows whether there is a wafer on blade 1. For a pre-aligner, shows the wafer presence status from the vacuum sensor. (1: Has wafer, 0: No wafer)
	Bit2	Wafer presence Status 2	For a manipulator, shows whether there is a wafer on blade 2. For a pre-aligner, shows the wafer presence status from the CCD sensor. (1: Has wafer, 0: No wafer)
	Bit3	Reserve	

INIT (Unit initialization)

Initializes specified unit.

[Conditions]

- The specified unit is in ready status.

Address(SYS)	001002	001003	001004
Info	Error clear Yes/No (1 byte) • Error clear	Servo ON Yes/No (1 byte) • Servo ON	Axes that move to home position (1 byte) • Go to HOME position

MTRS (Perform wafer transfer operation (Get/Put/Exchange operations))

Performs wafer transfer (Get/Put/Exchange) operations for the specified transfer station.

Each axis moves in the following order:

- (1) Check that the wafer exists.
- (2) Move the arm to the minimum sweep position through the safe path.
- (3) Move to ready position with the specified adjustment offset.
- (4) Perform the wafer transfer operation (Get/Put/Exchange) using the specified adjustment offset.

Refer to "(6) Create transfer point and Motion Pass" for the sequence of actions.

Note)

[Conditions]

- The specified unit is in ready status.
- The specified unit is in servo ON status.
- T.P.'s mode selector switch is set to Host mode (if T.P. is connected).
- The specified transfer station has been registered.

Performs wafer transfer (Get/Put/Exchange) operations for the specified transfer station.

MCTR (Continued wafer transfer operation + Transfer operation)

Immediately after the "MTRS" or "MCTR" command, the specified wafer transfer operation continues, and once the operation is completed, the wafer transfer operation of the newly specified station is performed.

[Conditions]

- The specified unit is in ready status.
- The specified unit is in servo ON status.
- T.P.'s mode selector switch is set to Host mode (if T.P. is connected).
- The specified transfer station has been registered.
- The action command immediately before this command has to be a successfully completed "MTRS", "MCTR", or "MPNT" command. (The action command immediately before this command is executed should be "MTRS" which has been completed successfully. "MCTR" or "MPNT" command)

- The specified transfer station has been registered.

Address(SYS)	001131	001132
Info	Memory specification (1 byte)	Transfer station (3 bytes)
Type	BIT	ASCII(3)
Value	<ul style="list-style-type: none"> • Bit0 : Volatile memory. • Bit1 : Non-volatile memory. 	<ul style="list-style-type: none"> • "C01" - "C08" : Cassette stage (the lowest-layer position). • "H01" - "H08" : Cassette stage (the highest-layer position). • "S01" - "S12" : Transfer stage. • "P01" : P/A stage.

Address(SYS)	001134	001135
Info	Slot number (2 bytes)	Arm Posture (1 byte)
Type	DEC(16Bit)	BIT
Value	<p><Cassette stage></p> <ul style="list-style-type: none"> • "01" - "30" : If <TrsSt> is "C01"- "C08"(cassette stage), set the slot. • "00" : If <TrsSt> is "H01"- "H08"(cassette stage), recognize the highest-layer position. <p><Transfer stage, Pre-aligner stage></p> <ul style="list-style-type: none"> • "00" : Fixed value t(because this type of station does not have multiple slots.) <p>Note) If value is less than 2 digits, fill the higher digit with '0' so that the field always has 2 digits.</p>	<ul style="list-style-type: none"> • Bit0 : Left elbow. • Bit1 : Right elbow.

Address(SYS)	001136	001137
Info	Blade (1 byte)	Position type (1 byte)
Type	BIT	BIT
Value	<ul style="list-style-type: none"> • Bit0 : Blade 1. • Bit1 : Blade 2. 	<ul style="list-style-type: none"> • Bit0 : Registered position. • Bit1 : Ready position. • Bit2 : Intermediate position. • Bit3 : Mapping start position. • Bit4 : Mapping finish position. <p>Note) For a mapping start/finish position, slot number and blade number specifications are ignored.</p> <p>Note) If <Mem> is N(Non-volatile memory), specified 'S'</p>

Address(PLC)	RSTP0 – RSTP4
Info	Coordinate (8 bytes each, Resolution: 0.001 [mm]/[deg])
Type	DEC(32Bit)
Value	Note) Specified in the range between “-9999999” and “99999999”. If a value is less than the specified digits, fill the higher digit(s) with '0' so that the field always has specified digits. A sign is added to the highest digit. Note) Response for all axes of the specified unit

Address(SYS)	RSTP_SET
Info	Read after parameter setting
Type	BIT
Value	<ul style="list-style-type: none"> • Bit0 = ON(READ) • Bit0 = OFF(STOP)

RSTR (Reference Transfer station information)

References the stations information.

[Conditions]

None.

Address(SYS)	001138	001139
Info	Memory specification (1 byte)	Transfer station (3 bytes)
Type	BIT	ASCII(3)
Value	<ul style="list-style-type: none"> • Bit0 : Volatile memory. • Bit1 : Non-volatile memory. 	<ul style="list-style-type: none"> • "C01" - "C08" : Cassette stage. • "S01" - "S12" : Transfer stage. • "P01" : P/A stage.

Address(SYS)	001141
Info	Transfer station information - Item (2 bytes)
Type	DEC(16Bit)
Value	<ul style="list-style-type: none"> • See the supplementary explanation.

Item	Contents
"00"	Downward offset
"01"	Upward offset
"02"	Grip position offset
"06"	G2/P3 Offset in the extending direction
"08"	Put downward offset
"30"	Get operation Move_grip function yes/no

RERR (Reference Error History)

References the error record of the specified device.

[Conditions]

None.

Address(SYS)	001145	001146
Info	Memory (1 byte)	Error history number (3 bytes)
Type	BIT	HEX(16Bit)
Value	<ul style="list-style-type: none"> • Bit0 : Volatile memory. • Bit1 : Non-volatile memory. 	<ul style="list-style-type: none"> • "FFF" : Notify all error history (latest 32 records notified). • "000" - "127" : Notifies the details of the specified error history number ("000" is the latest error code).

Notify all error history

Address(PLC)	RERR00 – RERR31
Info	Notify all error history-Error code (4 bytes)
Type	DEC(16Bit)
Value	Note) The smaller the value of N, the newer the error code. If no errors have occurred, "0000" is responded.

Notify specified error history number details

Address(PLC)	RERR00 – RERR08
Info	Notify specified error history number details - Error code (4 bytes), Servo error code (3 bytes), Sub-error code (5 bytes), Time occurred (12 bytes)
Type	DEC(16Bit)
Value	Error code (4 bytes) <ul style="list-style-type: none"> • If no errors have occurred, "0000" is responded. Servo error code (3 bytes) <ul style="list-style-type: none"> • If no errors have occurred, "0000" is responded. Sub-error code (5 bytes) <ul style="list-style-type: none"> • If no errors have occurred, "0000" is responded. Time occurred (12 bytes) Note) "Year/Month/Day/Hour/Minute/Second" format responded (2 bytes each). If no errors have occurred, "000000000000" is responded.

Address(SYS)	RERR_SET
Info	Read after parameter setting
Type	BIT
Value	<ul style="list-style-type: none"> • Bit0 = ON(READ) • Bit0 = OFF(STOP)

RMSK (Reference Interlock Monitoring Enable/Disable Information)

References Interlock Monitoring information.

[Conditions]

None.

Address(PLC)	RMSK0
Info	Interlock information (4 bytes)
Type	DEC(16Bit)
Value	• See the supplementary explanation.

< Manipulator >

RVER (Reference Software Version)

References software version.

[Conditions]

None.

Address(PLC)	RVER0	RVER1
Info	System software version (8 bytes)	Servo software version(8 bytes)
Type	DEC(32Bit)	DEC(32Bit)
Value		

RMAP (Reference Mapping Result)

References the specified transfer station's mapping results.

[Conditions]

- T.P.'s mode selector switch is set to Host mode (if T.P. is connected).
- The mapping operation has completed normally.

Address(PLC)	RMAP0 – RMAPN
Info	Mapping result (2 bytes each)
Type	ASCII(2)
Value	<ul style="list-style-type: none"> • "--" : No wafer detected. • "OK" : Wafer inserted correctly. • "CW" : Wafer inserted incorrectly (inclined). • "DW" : Wafer inserted incorrectly (duplicated). Note) Responds with the number of slots of the specified transfer station.

Address(SYS)	RMAP_SET
Info	Read after parameter setting
Type	BIT
Value	<ul style="list-style-type: none"> • Bit0 = ON(READ) • Bit0 = OFF(STOP)

RMPD (Reference Mapping Data)

(Elevation axis coordinates during sensor edge startup/stopping).

Executes the mapping for the specified transport station.

[Conditions]

- T.P.'s mode selector switch is set to Host mode (if T.P. is connected).
- Mapping operations have completed normally.

Address(PLC)	RMPD_UP00 – RMPD_UP30
Info	Sensor edge startup elevation axis coordinates (8 bytes, Resolution: 0.001 [mm])
Type	DEC(32Bit)
Value	Note) The range is between “-9999999” and “99999999”. If a value is less than the specified digits, fill the higher digit(s) with ‘0’ so that the field always has specified digits.

Address(PLC)	RMPD_DN00 – RMPD_DN30
Info	Sensor edge stopping elevation axis coordinates (8 bytes, Resolution: 0.001[mm])
Type	DEC(32Bit)
Value	Note) The range is between “-9999999” and “99999999”. If a value is less than the specified digits, fill the higher digit(s) with ‘0’ so that the field always has specified digits. Note) Updata and Dndata always responds with 30 sets of data. Data is responded as it is detected, and if 30 sets are not detected, “00000000” is responded. The slot no. and the data no. may not match.

Address(SYS)	RMPD_SET
Info	Read after parameter setting
Type	BIT
Value	<ul style="list-style-type: none"> • Bit0 = ON(READ) • Bit0 = OFF(STOP)

RMCA (Reference Calibration Result for Mapping)

References the mapping calibration result.

[Conditions]

- Calibration operation for mapping has completed normally.

Address(PLC)	RMCA0 – RMCA5
Info	Reference Calibration Result for Mapping
Type	DEC(32Bit)
Value	<ul style="list-style-type: none"> • Value1 : Lowest-layer slot position (8 bytes, Resolution: 0.001 [mm]) • Value2 : Highest-layer slot position (8 bytes, Resolution: 0.001 [mm]) • Value3 : Wafer width (8 bytes, Resolution: 0.001 [mm]) • Value4 : The threshold value of double insertion (8 bytes, Resolution: 0.001 [mm]) • Value5 : The threshold value of slanting insertion1 (8 bytes, Resolution: 0.001 [mm]) • Value6 : The threshold value of slanting insertion2 (8 bytes, Resolution: 0.001 [mm]) <p>Note) The range is between “-9999999” and “99999999”.</p> <p>If value is less than 8 digits, fill the higher digit(s) with ‘0’ so that the field always has 8 digits.</p>

Address(SYS)	RMCA_SET
Info	Read after parameter setting
Type	BIT
Value	<ul style="list-style-type: none"> • Bit0 = ON(READ) • Bit0 = OFF(STOP)

RALN (Reference Alignment Result)

References the alignment result.

[Conditions]

- T.P.'s mode selector switch is set to Host mode (if T.P. is connected).
- Alignment has been completed normally.

Address(PLC)	RALN0 – RALN9
Info	Reference Alignment Result
Type	DEC(32Bit)
Value	<ul style="list-style-type: none"> • Value1 : Wafer eccentricity before alignment operation (8 bytes, Resolution: 0.001 [mm]) • Value2 : Wafer eccentricity direction before alignment operation (8 bytes, Resolution: 0.001 [deg]) • Value3 : Notch/Orientation Flat direction before alignment operation (8 bytes, Resolution: 0.001 [deg]) • Value4 : X direction offset amount before alignment operation (8 bytes, Resolution: 0.001 [mm]) • Value5 : Y direction offset amount before alignment operation (8 bytes, Resolution: 0.001 [mm]) • Value6 : Pre-aligner adjustment angle (8 bytes, Resolution: 0.001 [deg]) • Value7 : Manipulator adjustment amount (8 bytes, Resolution: 0.001 [mm]) • Value8 : Manipulator adjustment angle (8 bytes, Resolution: 0.001 [deg]) • Value9 : X direction offset amount after alignment operation (8 bytes, Resolution: 0.001 [mm]) • Value10 : Y direction offset amount after alignment operation (8 bytes, Resolution: 0.001 [mm]) • Refer to the Supplementary Explanation <p>Note) If a value is less than the specified digits, fill the higher digit(s) with '0' so that the field always has specified digits.</p>

RACA (Reference Calibration Result for Alignment)

References the calibration results for alignment.

[Conditions]

Calibration for alignment has finished normally.

Address(PLC)	RACA0 – RACA2
Info	Reference Calibration Result for Alignment
Type	DEC(32Bit)
Value	<ul style="list-style-type: none"> • Value1 : Calibration angle (8 bytes, Resolution: 0.001 [deg]) • Value2 : Manipulator advance angle (8 bytes, Resolution: 0.001 [deg]) • Value3 : Manipulator swivel center to pre-aligner swivel center distance (8 bytes, Resolution: 0.001 [mm]) <p>Note) If a value is less than the specified digits, fill the higher digit(s) with '0' so that the field always has specified digits.</p>

RCCD (Reference Light Amount and CCD Sensor Values)

References the pre-aligner's light amount and CCD sensor value.

[Conditions]

None.

Address(PLC)	RCCD0	RCCD1
Info	Light amount value (5 bytes)	CCD sensor value (5 bytes)
Type	DEC(32Bit)	DEC(32Bit)
Value	Note) Specified in the range between "00000" and "99999". If a value is less than the specified digits, fill the higher digit(s) with '0' so that the field always has specified digits.	Note) Specified in the range between "00000" and "99999". If a value is less than the specified digits, fill the higher digit(s) with '0' so that the field always has specified digits.

RLOG (Reference Log Information)

References the specified log data.

[Conditions]

None

Address(PLC)	RLOG0
Info	Log data (Variable byte)
Type	DEC(32Bit)
Value	• Refer to the supplementary explanation.

Log Number (LogNo)	Contents	Log Data (LogDat)
"00"	Power On times (6 bytes) (Accumulated no. of times)	• Specified in the range between "000000" and "999999".
"01"	Servo On times (6 bytes) (Accumulated no. of times)	• Specified in the range between "000000" and "999999".
"02"	Brake times (6 bytes) (Accumulated no. of times)	• Specified in the range between "000000" and "999999".

Address(SYS)	RLOG_SET
Info	Read after parameter setting
Type	BIT
Value	• Bit0 = ON(READ) • Bit0 = OFF(STOP)

RSTN (Reference the Reference Position)

References the reference position.

[Conditions]

None

Address(PLC)	RSTN0 – RSTN5
Info	Reference position of the encoder value (12 bytes each)
Type	DEC(32Bit)
Value	<ul style="list-style-type: none"> • Value1 : Arm 1. • Value2 : Arm 2. • Value3 : Wrist axis 1. • Value4 : Wrist axis 2. • Value5 : Elevation axis. <p>Note) Specified in the range between “-02147483648” and “002147483647”.</p> <p>If a value is less than the specified digits, fill the higher digit(s) with '0' so that the field always has specified digits.</p> <p>A sign is added to the highest digit.</p> <p>Note) The number of “ValueN” depends on the unit type. Set as many axis numbers as the specified unit has.</p>
