## _1OFF Conversion

When converting a project from **XDesignerPlus** to **TOP Design Studio**, a build error may occur if **the special address _1OFF** is used in the project. (This is because _1OFF is no longer supported.)

You must replace this address with another valid address.
Follow the steps below to change the address:

[Pic. Cross Reference]

### (1) Open Address/Object Search

From the top menu, select [Tool] - [Cross Reference].

[Pic. Cross Reference]

(2) Search / Select SYS Addresses

In the search window, change the PLC option to SYS, then click Search, and then select an **Unused SYS Address**.
Check the list and identify an unused SYS address. (In this manual, **SYS 10239.15** is used as an example.)

(3) Replace _1OFF

Change **the _1OFF address** to **the unused SYS address** you identified (e.g., **SYS 10239.15**).

Important Notes

-. If **_1OFF** was **only used to display an "OFF" image** (and not for control), you can simply replace it as described above.

-. If **_1OFF** was **used as a special control address connected to the PLC**, you must carefully review the logic before making changes.

-. The **original function of _1OFF** was to automatically **set its value to 0** when a screen started or switched.
